

2021 Patient Outcomes

We are extremely proud of the number of our patients who have increased their independence in our inpatient rehabilitation program. Changes in independence are measured using the Quality Index Measures (QM), which helps assess how well patients can manage daily tasks such as dressing, grooming and locomotion. Patients are measured when they arrive (admission) and throughout their stay in inpatient rehabilitation. By the time patients leave the rehab program (discharge), we expect an increase in QM in the range of 35 to 45 points. Our overall target is 44.76. Of the 405 patients served here in 2021, the overall QM gain attained was 43.1 which is slightly below the expected overall target due to the pandemic and implementation of the CMS waiver.

Patients who responded to our survey consistently rated our services at 95% for overall Patient Satisfaction. Our survey response rate is 64%.

Our greatest achievements are in preparing our patients to return home or to a community setting, 84.6% achieved this successfully!

Please see the back of the page for more information on the types of patients we see, their length of stay in the program and their QM gains.
