

2021 Stroke Patient Outcomes

We are extremely proud of the number of our patients who have increased their independence in our inpatient rehabilitation program. Changes in independence are measured using Quality Index Measures (QM), which helps assess how well patients can manage daily tasks such as dressing, grooming and locomotion. Patients are measured when they arrive (admission) and throughout their stay in inpatient rehabilitation. By the time patients discharge the rehab program, we expect an increase in QM in the range of 35 to 45 points. Our overall target is 40. Of the 115 patients served here in 2021, the overall QM gain attained was 43.1 which exceeded the national average and our expected overall target.

Our greatest achievements are in preparing our patients to return home or to a community setting, 87% achieved this successfully! Patients who responded to our survey consistently rated our services at 95% for overall Patient Satisfaction. Our survey response rate is 62%.

Outcome Performance Measure	National Average	El Camino Health Acute Rehab
Patients returning to a community living setting	79.5%	80.9%
Patients improvement in functional areas such as mobility and self-care status (QM)	41.7	43.1
Average Length of Stay (days)	14.6	13.8
Overall Patient Satisfaction with the Acute Rehabilitation Center		95%
Percentage of our patients that would recommend our rehab to a friend or family member		96%
Total Number of Stroke Patients Served: 115		
Average Age: 70.8		
Gender: Male 50.4% Female 49.6%		
Our patients receive at least 3 hours of therapy per day, 5 days per week
